## The acoustic scattering Problem in full space

### 1.1 Introduction

We study the wave equation in full space  $\mathbb{R}^d$ ,  $d \in \{1, 2, 3\}$ .

$$\frac{\partial^2}{\partial t^2} p + \gamma \frac{\partial}{\partial t} p = c^2 \Delta p$$

Where

$c = c(x)$  speed of sound

$\gamma = \gamma(x)$  damping coefficient

Assume *time-periodic behaviour*

$$p(x, t) = \operatorname{Re}[u(x)e^{-i\omega t}]$$

with frequency  $\omega$  and a real-valued function  $u$ .

Since

$$\begin{aligned}\frac{\partial^2 p(x, t)}{\partial t^2} &= \operatorname{Re}[-\omega^2 u(x)e^{-i\omega t}] \\ \frac{\partial p(x, t)}{\partial t} &= \operatorname{Re}[-i\omega u(x)e^{-i\omega t}] \\ \Delta p(x, t) &= \operatorname{Re}[\Delta u(x)e^{-i\omega t}]\end{aligned}$$

for all times  $t > 0$ , we infer

$$-\omega^2 u - \gamma i\omega u = c^2 \Delta u, \quad \text{in } \mathbb{R}^d.$$

This is equivalent to

$$\Delta u + \frac{\omega^2}{c^2} \left( 1 + \frac{i\gamma}{\omega} \right) u = 0.$$

We assume, that  $c = c_0$  is constant in free space (reference value). We can now define a *wave number*

$$\kappa = \underbrace{\frac{\omega}{c_0}}_{>0} > 0$$

and the *index of refraction*

$$n(x) = \frac{c_0^2}{c(x)^2} \left( 1 + i \frac{\gamma}{\omega} \right).$$

This results in the *Helmholtz-Equation*

$$\Delta u + \kappa^2 n u = 0, \quad \text{in } \mathbb{R}^d.$$

We assume that there exists  $a > 0$  such that

$$c(x) = c_0 \text{ and } \gamma(x) = 0, \quad \forall |x| > a,$$

that means inhomogeneities of the medium lie inside some bounded region (inside a ball). Furthermore we assume, that outside this ball of radius  $a$ ,  $\overline{B_a(0)}$ , there are sources that generate plane waves, that is functions of the type

$$u^{in}(x) = e^{ikx \cdot \hat{\theta}},$$

where  $|\hat{\theta}| = 1$  for  $\hat{\theta} \in \mathbb{R}^d$  and  $\cdot$  denotes the inner product in  $\mathbb{R}^d$ . Then,  $u^{in}$  satisfies

$$\Delta u^{in} + k^2 u^{in} = 0.$$

(just calculation). This  $u^{in}$  generates a *scattered field*  $u^s$ . The *total field*

$$u = u^{in} + u^s$$

satisfies

$$\Delta u + \kappa^2 n u = 0.$$

Furthermore we assume *Sommerfeld's radiation condition* ( $r = |x|$ ):

$$\frac{\partial u^s}{\partial r} - i\kappa u^s(x) = o\left(r^{\frac{1-d}{2}}\right), \quad \text{as } r = |x| \rightarrow \infty$$

uniformly in  $\frac{x}{|x|}$ .

Figure 1.1: Visualization of the problem

## 1.2 Theory for the direct Scattering Problem in $\mathbb{R}^3$

Throughout this section  $d = 3$  holds! Furthermore

1.  $\hat{\theta} \in \mathbb{R}^3$  with  $|\hat{\theta}| = 1$  defines the *indicent field*

$$u^{in}(x) = e^{-i\kappa\hat{\theta}\cdot x}, \quad x \in \mathbb{R}^d$$

2.  $\kappa \in \mathbb{R}, \kappa > 0$
3.  $n \in L^\infty(\mathbb{R}^3), \operatorname{Re} n \geq 0, \operatorname{Im} n \geq 0$  and  $n(x) = 1$  for all  $x \in \mathbb{R}^3 \setminus B_a(0)$  and some  $a > 0$

We recall

$$H_{loc}^1(\mathbb{R}^3) := \{u : \mathbb{R}^3 \rightarrow \mathbb{C} : u|_K \in H^1(K), \quad \text{for every } K = B_R(0) \text{ and any } R > 0\}$$

The *Scattering Problem* reads as follows

**Definition 1.1.** Scattering Problem (S) Govern  $\hat{\theta}, \kappa, n$  as above. Seek  $u \in H_{loc}^1(\mathbb{R}^3)$  such that

$$\Delta u + \kappa^2 n u = 0$$

in  $\mathbb{R}^3$  in the weak sense, that is

$$\int_{\mathbb{R}^3} (\nabla u \cdot \nabla \bar{\Psi} - \kappa n u \bar{\Psi}) dx = 0$$

for any  $\Psi \in H^1(\mathbb{R}^3)$  with compact support, and s.t.

$$u^s = u - u^{in}$$

satisfies Sommerfeld's radiation condition ( $d = 3$ , sharper version)

$$\frac{\partial u^s}{\partial r} - i\kappa u^s = O\left(\frac{1}{r^2}\right), \quad \text{uniformly in } \hat{x} = \frac{x}{|x|} \text{ as } r = |x| \rightarrow \infty$$

*Remark 1.2.* Regularity-theory tells us, that the radiation condition is well-defined, given the assumptions from ??.

**Theorem 1.3**

*Rellich's Lemma* Let  $u$  satisfy  $\Delta u + \kappa^2 u$  for every  $|x| > a$ . The following property

$$\lim_{R \rightarrow \infty} \int_{|x|=R} |u(x)|^2 dS = 0$$

implies, that  $u(x) = 0$  for all  $|x| > a$ .

*Remark 1.4.* Vice versa, if the property in ?? does not hold, then  $u$  cannot vanish for all  $|x| > a$ .

PROOF. Employs spherical Bessel functions, see e.g. ■

For the proof of uniqueness, we require results on periodic differential equations. We recall *Fourier representations of periodic functions*:

Define

$$Q := (-\pi, \pi)^3 \subseteq \mathbb{R}^3.$$

The functions

$$\{\varphi_j : j \in \mathbb{Z}^3\}$$

with

$$\varphi_j(x) = \frac{1}{(2\pi)^3} e^{ij \cdot x}, \quad \forall x \in Q, j \in \mathbb{Z}^3$$

define a complete orthonormal system (ONS) of  $L^2(Q)$  and every  $g \in L^2(Q)$  has the expansion

$$g = \sum_{j \in \mathbb{Z}^3} g_j \varphi_j, \quad \text{with } g_j = \int_Q g \varphi_j dx, \quad \text{for } j \in \mathbb{Z}^3.$$

Panceval's inequality shows

$$\|g\|_{L^2(Q)}^2 = \sum_{j \in \mathbb{Z}^3} |g_j|^2.$$

Furthermore, if  $g \in L^2(Q)$  and  $\sum_{j \in \mathbb{Z}^3} |j|^2 |g_j|^2 < \infty$ , where  $|j| = |j_1| + |j_2| + |j_3|$ , then  $g \in H^1(Q)$ .

Define

$$H_{per}^1(Q) := \left\{ g \in L^2(Q) : \sum_{j \in \mathbb{Z}^3} (1 + |j|)^2 |g_j|^2 < \infty \right\}$$

and identify  $L^2(Q)$  and  $H_{per}^1(Q)$  with the corresponding periodic functions in  $\mathbb{R}^3$  by

$$g(2\pi j + x) = g(x), \quad \text{for } x \in Q, j \in \mathbb{Z}^3.$$

**Lemma 1.5**

Let  $p \in \mathbb{R}^3, a \in \mathbb{R}$  and  $\hat{e} = \begin{bmatrix} 1 \\ i \\ 0 \end{bmatrix}$ . Then, for every  $t > 0$  and every  $g \in L^2(Q)$  there exists a unique solution  $w = w_t(g) \in H_{per}^1(Q)$  to the differential equation

$$\Delta w + \lambda_t \cdot \nabla w + \mu_t w = g \quad (*)$$

understood weakly, that is

$$\forall \Psi \in C_c^\infty(Q) : \quad \int \left( -\nabla w \cdot \nabla \bar{\Psi} + (\lambda_t \cdot \nabla w + \mu_t w) \bar{\Psi} \right) dx = \int_Q g \bar{\Psi} dx$$

for  $\lambda_t := 2t\hat{e} - ip$ ,  $\mu_t = -(it + a)$ . It holds that

$$\|w\|_{L^2(Q)} \leq \frac{1}{t} \|g\|_{L^2(Q)},$$

this means that

$$L_t : L^2(Q) \rightarrow L^2(Q) \text{ defined by } g \mapsto w_t(g)$$

defines a bounded operator

$$\|L_t\| \leq \frac{1}{t}, \quad \forall t > 0.$$

PROOF. With the Fourier expansions

$$g = \sum_{j \in \mathbb{Z}^3} g_j \varphi_j \quad \text{and} \quad w = \sum_{j \in \mathbb{Z}^3} w_j \varphi_j,$$

?? transforms to

$$\forall j \in \mathbb{Z}^3 : \quad c_j w_j = g_j, \quad \text{with } c_j = -|j|^2 + ij \cdot \lambda_t + \mu_t.$$

We have

$$|c_j| \geq |\operatorname{Im} c_j| \stackrel{\text{insert}}{=} |2tj \cdot \hat{e} - t| = t \underbrace{|2\hat{e} \cdot j - 1|}_{\geq 1} \geq t.$$

Thus, the operator

$$(L_t g) := \sum_{j \in \mathbb{Z}^3} \frac{g_j}{c_j} \varphi_j, \quad \text{with } g \in L^2(Q),$$

is well-defined and satisfies

$$\|L_t\| \leq \frac{1}{t}, \quad \forall t > 0.$$

It remains to show, that  $w$  is really a solution to the differential equation. In order to do so, let  $\Psi \in C_c^\infty(Q)$ . As  $\Psi$  has compact support, function-value and all derivatives are zero on the boundary of  $Q$ , and therefore we have also that  $\Psi$  is periodic. We can represent

$$\Psi = \sum_{j \in \mathbb{Z}^3} \Psi_j \varphi_j.$$

Then

$$\begin{aligned} \int_Q \left( -\nabla w \cdot \nabla \bar{\Psi} + (\lambda_t \nabla w + \mu_t w) \bar{\Psi} \right) dx &= \sum_{j \in \mathbb{Z}^3} c_j w_j \cdot \bar{\Psi}_j \\ &= \sum_{j \in \mathbb{Z}^3} g_j \cdot \bar{\Psi}_j \\ &= \int_Q g \bar{\Psi} dx. \end{aligned}$$

**Theorem 1.6**

*Unique continuation principle* Let  $u \in H_{loc}^1(\mathbb{R}^3)$  solve  $\Delta u + \kappa^2 n u = 0$ , where  $n \in L^\infty(\mathbb{R}^3)$  with  $n(x) = 1$  for  $|x| > a$ , and let  $b \geq a$ , such that  $u(x) = 0$  for all  $|x| \geq b$ . Then we have  $u = 0$  in  $\mathbb{R}^3$ .

*Remark 1.7.* ?? holds in a much more general version than we stated here.
